FOR YOUR SAFETY

Watch for rattlesnakes while viewing the fossil areas or walking anywhere in the park. Avoid these snakes; do not molest them.

U.S. DEPARTMENT OF THE INTERIOR

AGATE FOSSIL BEDS

Nineteen million years ago strange creatures walked a Miocene savanna. Careful digging at these quarries has brought to light the bones of these animals so long extinct.

Here at Agate Fossil Beds National Monument are concentrated the fossils of animals in beds of sedimentary rock, formed, about 19 million years ago, by the compression of mud, clay, and erosional materials deposited by the action of water and wind. These species of animals, then so numerous, have long been extinct. The beds, which acquired their name from their proximity to rock formations containing agates, are under the grass-covered Carnegie and University Hills. From the summits of these hills, named by early collecting parties, you can look down on the lazy meanders of the Niobrara River, 200 feet below.

Early pioneers of scientific research in the West centered many of their activities here. Capt. James H. Cook was the first white man to discover fossil bones at Agate Fossil Beds, about 1878. Since then, bones from the site have been exhibited throughout the world. Captain Cook and his son, Harold, made Agate Springs Ranch a headquarters for paleontologists and acquired an excellent fossil collection.

AGATE FOSSIL BEDS TODAY

Scientists estimate that at least 75 percent of the fossil-bearing parts of the hills are unquarried. The Miocene fossil mammal bones are extremely abundant, comprise a variety of different species, and are remarkably well preserved, with numerous complete skeletons.

Except for livestock that graze on the hills which relieve the comparatively flat open valley of the Niobrara River, the scene is relatively undisturbed. The landscape is carpeted predominantly with grasses such as prairie sandreed, blue grama, little bluestem, and needle-and-thread. The prairie flowers—lupine, spiderwort, western wallflower, sunflower, and penstemon—add color to this grassland scene. Small soapweed, a yucca, growing on the hillsides, is particularly attractive, especially in late summer when its dark green spears stand out among the brown grass. Cottonwoods and willows along the river add to the attractiveness of the scene and supply resting places and shelter for birds and other animals.

Animals are typical of the western plains: mule deer, pronghorn, coyote, cottontail, and prairie rattlesnake.

DEVELOPMENT OF AGATE FOSSIL BEDS

The Service plans to expose representative fossil remains at Carnegie and University Hills by removing the layers of sediments above the 2- to 3-foot thick horizontal fossil beds. You will then be able to see the fossil skeletons of many creatures just as they were buried millions of years ago, and feel closely associated with the now-extinct animals of a past age. Here, too, you will have an opportunity to watch scientists exposing the deposits and relicfing certain deposits in place.

Plans call for interpretive structures at major points of interest and for permanent buildings at the headquarters site. Roads, trails, and a bridge across the Niobrara River will provide access to these points.
GEOLoGY OF THE FOSSIL SITE
The Agate site contains an outstanding record of a chapter of evolution frequently referred to as the Age of Mammals because of the tremendous increase in species and numbers of mammals during that period. All of Agate's fossil deposits are found in what geologists call the Arikaree Group of the Mississippian Period, which spanned the period from 25 to 13 million years ago. The group is in turn divided into three formations—Gering, Monroe, and Harrison. The Harrison beds contain practically all of the known fossils at this site. The sedimentary rocks of this group are principally sandstone. The quarries are in the upper part, which was laid down perhaps a million or more years after the lower part of the formation.

ANCIENT LIFE
By far the most common mammal at Agate Fossil Beds was the Menoceras, a two-horned rhinoceros. This fleet-footed grazer was smaller than a Shetland pony and roamed the plains in numbers as great as our bison once did.

The most unusual looking animal was the Menoceras, or "Terribi, Pig"—a monstrous beast more than 7 feet tall at the shoulders and about 10 feet long. It had a massive head with large tusks and a small brain. How­ever, unlike our domestic pig, its legs were quite long and slender. It was apparently an aggressive creature and was frequently wounded in battle.

Perhaps the most ferocious was the Dinohvus, or "Terrifi, Pig."—a monstrous beast more than 7 feet tall at the shoulders and about 10 feet long. It had a massive head with large tusks and a small brain. However, unlike our domestic pig, its legs were quite long and slender. It was apparently an aggressive creature and was frequently wounded in battle.

Large herds of a delicate, graceful little mammal—Dinohvus, or "Terrifi, Pig."—a monstrous beast more than 7 feet tall at the shoulders and about 10 feet long. It had a massive head with large tusks and a small brain. However, unlike our domestic pig, its legs were quite long and slender. It was apparently an aggressive creature and was frequently wounded in battle.

In 1906, Prof. E. B. Loomis and a party from An herst College joined the collectors. They excavated in a small hill which Loomis called Amherst Point. Returning in 1907 and again in 1908, the Loomis party discovered a quarry of Stenomylus skeletons. Approximately 18 skulls, together with enough scattered bones to complete the skeletons, were collected from one pocket. In an adjacent area, three complete skeletons were found.

In 1909, the Carnegie Museum removed at least 40 skeletons. The American Museum of Natural History collected here for about 20 years, starting in 1910.

Several other institutions sent collecting parties to Agate in later years. Visitors are welcome at site, being currently excavated when the paleontologists are working.

THE FOSSIL-COLLECTING STORY
In the summer of 1904, O. A. Peterson of the Carnegie Museum of Pittsburgh came to Agate, and with the able assistance of Harold Cook, then 17, conducted the first scientific excavation at this site. They discovered a rich quarry containing a type of rhino­ceros that was new to science.

In 1905, Prof. E. H. Barbour and four students of the University of Nebraska opened a quarry in the side of University Hill. Both the Carnegie Museum and the University of Nebraska worked their respective quarries for a number of collecting seasons. Valparaiso University also collected at the quarries about the same time.

The most unusual animal was the Menoceras, or "Terrific Pig,"—a monstrous beast more than 7 feet tall at the shoulders and about 10 feet long. It had a massive head with large tusks and a small brain. However, unlike our domestic pig, its legs were quite long and slender. It was apparently an aggressive creature and was frequently wounded in battle.

THE COOK FAMILY
To learn how this site in the valley of the Niobrara became one of such intense interest, you must know something about the Cook family.

Capt. James H. Cook acquired the Agate Springs Ranch in 1887 from his father-in-law, Dr. E. B. Graham, who had established it a few years earlier as the O-4 Ranch.

At 16, James left his home in Michigan and became a cowboy riding herd on unpredictable Texas long­horns on long cattle drives from Mexico to Montana. He was a big game hunter and guide in 1878 in Wyoming and later in New Mexico.

Captain Cook served with distinction as a scout attached to the 8th U.S. Cavalry in New Mexico during the campaign of 1885-86 against the famous Apache chieftain, Geronimo. During this service, he married Kate Graham; he settled for the rest of his life at the Agate Springs Ranch, which once had been part of the Sioux Indian lands.

Cook had made friends with Professors E. D. Cope and O. C. Marsh, who were two of the world's most renowned paleontologists. Because of his associations with them and other prominent scientists, he became keenly interested in this field.

He looked upon the Indians as friends. Because this, he acquired a large collection of Indian artifacts. Best known of his Indian friends was Red Cloud, the daring Sioux chieftain.

ABOUT YOUR VISIT
The monument is 23 miles south of U.S. 20 at Har­rison, via Nebr. 29, or 34 miles north of U.S. 2b at Mitchell, via Nebr. 29. Rental cars are available at Scottsbluff. A scheduled airline has flights to Scottsbluff within an hour's drive of the national monument site.

Monument headquarters, located between the Niobrara River and the county road, is about 3 miles east of Agate Springs Ranch. The visitor center has exhibits on the fossil story. Nearby is a self-guiding trail to an area of exposed fossils.

There are no facilities at the monument for camping. Restaurants and overnight accommodations are avail­able in nearby towns.

Everything here is preserved and protected for all visitors. Therefore, collecting of fossils, rocks, or plants is not allowed.

ADMINISTRATION
Agate Fossil Beds National Monument, the establish­ment of which was authorized on June 5, 1965, is administered by the National Park Service, U.S. Department of the Interior.

The monument, consisting of approximately 7,700 acres, is located in northwestern Nebraska. Approximately 60 acres containing the Stenomylus quarry is included.

The superintendent of Scotts Bluff National Monu­ment, whose address is Box 427, Gering, Neb. 69341, is in charge of Agate Fossil Beds National Monu­ment. A park ranger is on duty at the site.

As the Nation's principal conservation agency, the Department of the Interior is responsible for most of our nationally owned public lands and natural resources. This includes fostering the wise use of our land and water; protecting our wildlife; preserving the environmental and cultural values of our national parks and historic places; and providing for the enjoyment of all through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people.
