Notes:

The Cornell Lab of Ornithology's eBird website allows you to report observations made on hiking trips, personal searches, and point counts. You can set up a personal account that provides information on your reports, locations you have visited, and a checklist for all your life birds.

Your observations can also be viewed and analyzed by scientists and other eBird users, making it useful for the National Park Service. Currently, we are developing an NPS eBird Portal to capture park-specific hotspots. By reporting observations, park visitors can help us determine which birds are using the parks and if there are changes in community composition.

Birds of Booker T. Washington National Monument

Booker T. Washington National Monument encompasses 239 acres of forests, riparian areas, open woodlands, meadows, hayfields, pastures, demonstration crop fields, and garden areas. Such a wide range of habitats support a diverse array of bird species. So far over 100 species of birds have been detected in the park.

This checklist was developed from inventories conducted in the park in 2003 by scientists from the College of William and Mary and observations of members of the Roanoke Valley Bird Club over the past 20 years. The abbreviations below document when the species were observed and when they are most likely to be seen in the park. Space is provided on the left for you to check off the species you observe during your visit.

For additional information or to report species not found on the checklist, please contact our staff at

BOWA_Resource_Management@nps.gov.
