## FOREWORD

After the Civil War, the United States intensified exploration of the western frontier to gain a measure of the vast lands and natural resources in the region now occupied by the Rocky Mountain States. As part of this effort, the U.S. Geological and Geographical Survey of the Territories was formed and staffed under the leadership of geologist Ferdinand Vandiveer Hayden. Originally organized under the U.S. Public Land Office in 1861, the Hayden Survey (as it was most often identified) was placed under the Secretary of the Interior in 1869 and later under the U.S. Geological Survey established in 1879. Its records, maps, and photographs were then transferred to the latter agency.

In commemorating the centennial of the founding of Yellowstone National Park, the Geological Survey drew upon the items deposited by Hayden to describe the early exploration of the Yellowstone region and to recount the events that led to the establishment in 1872 of Yellowstone as the Nation's first national park.

"The Grand Canyon of the Yellowstone," an 1872 oil painting by Thomas Moran, reproduced here in one color.

During the past century, over 50 million people have visited Yellowstone National Park and marveled at its never-ending display of natural beauty. The camper, the hiker, the fisherman, and the naturalist, as well as the photographer and the artist, all enjoy the grandeur of the vast scenic area.

The park is also a source of great interest to the earth scientists. Recently, scientists of the U.S. Geological Survey have been cooperating with the National Park Service and the National Aeronautics and Space Administration (NASA) in probing the depths and farthest corners of the park. They are seeking answers to questions concerning the origin of Yellowstone's complex features; questions that have intrigued earth scientists since the first days of the Hayden Survey.

Ferdinand Vandiveer Hayden played a key role in establishing Yellowstone as the Nation's first national park. His accomplishments in 1871-72 were the high point of a long and distinguished career in public service.

Hayden was born in Westfield, Massachusetts, on September 7, 1829. After the death of his father, he was raised by an uncle on a farm in Rochester, Ohio. Being unusually studious, he left his uncle's farm,

Dr. Hayden in Union Army uniform during the Civil War. This was the only time he actually practiced medicine.

traveled to Oberlin, Ohio, and enrolled in the college there, although virtually penniless.

While a student at Oberlin College, Hayden developed a lifelong friendship with John Strong Newberry, a geologist. After graduating in 1850, he went on to the Medical College at Albany, New York. There he worked with Professor James Hall, a veteran geologist and paleontologist. The study of medicine was then the usual road to a career in geology and the natural sciences.

Though Hayden received his medical degree in 1853, he never entered the regular practice of medicine. Shortly after graduating, he set out on his first geological expedition under the sponsorship of Professor Hall. Accompanied by the paleontologist Fielding Bradford Meek, Hayden headed up the Missouri River to explore the Dakota Badlands and to collect fossil specimens. They returned in 1854, having added significant geological information to the knowledge of the Nation's western frontier.

During the Civil War, Hayden practiced medicine for the only time in his career, serving as a surgeon with the Union Army. After the war, he was appointed professor of geology and mineralogy at the University of Pennsylvania, a post he held mainly in absentia for the next 7 years. Much of this time he spent studying and reporting on the geology of the Nebraska Territory and the Rocky Mountain region.

In 1869, Hayden completed a highly successful scientific expedition through the western mountains from Denver to Santa Fe. This expedition set the pattern for those to follow: his team studied virtually all natural phenomena that they encountered, including wildlife, plant life, water resources, and mineral deposits.

Hayden, mounted on his horse Patsy, maintained a tenuous link with his professor's chair at the University of Pennsylvania by frequently wearing a frayed but eminently respectable dress coat.

When Hayden led his expedition into the Yellowstone area in 1871, it was almost the last unexplored region within the conterminous United States.

General James Wilkinson had reported the existence of the unique area to President Thomas Jefferson in 1805. Rumors of it had reached Hayden during his exploration of the upper Missouri country in the 1850's. An army expedition under Captain William F. Reynolds, of which Hayden was geologist-in-charge, failed to get through the snow-filled passes of the surrounding mountains in the 1860's. This failure served to whet Hayden's desire to explore the region where "hell spouted up."

Hayden's historic expedition was preceded by two expeditions which fired the imagination of those interested in that largely unknown region. The Folsom-Cook group penetrated the Yellowstone country in 1869, followed by the Washburn-Langford-Doane expedition in 1870.

The Hayden Survey, led by Lieutenant Gustavus C. Doane and military escort, enroute between the Yellowstone River and the East Fork.

Lieutenant Gustavus C. Doane, who served as leader of the military escort of the second expedition, filed a detailed report that was published as a Congressional document and became a landmark of the Yellowstone story. The following is taken from his report:

We kept the Yellowstone to our left, and finding the canyon impassable passed over several high spurs coming down from the mountains, over which the way was much obstructed by fallen timber, and reached, at an elevation of 7,331 feet, an immense rolling plateau extending as far as the eye could reach. This elevated slope of country is about 30 miles in extent, with a general declivity to the northward. Its surface is an undulated prairie dotted with groves of pine and aspen. Numerous lakes are scattered throughout its whole extent, and great numbers of springs, which flow down the slopes and are lost in the volume of the Yellowstone. The river breaks through this plateau in a winding and impassable canyon of trachyte lava over 2,000 feet in depth; the middle canyon of the Yellowstone, rolling over volcanic boulders (sic) in some places, and in others forming still pools of seemingly fathomless depth. At one point it dashes

here and there, lashed to a white foam, upon its rocky bed; at another it subsides into a crystal mirror where ever a deep basin occurs in the channels. Numerous small cascades are seen tumbling from the lofty summits a mere ribbon of foam in the immeasurable distance below. This huge abyss, through walls of flinty lava, has not been worn away by the waters, for no trace of fluvial agency is left upon rocks; it is cleft in the strata brought about by volcanic action plainly shown by that irregular structure which gives such a ragged appearance to all such igneous formations. Standing on the brink of the chasm the heavy roaring of the imprisoned river comes to the ear in a sort of hollow, hungry growl, scarcely audible from the depths, and strongly suggestive of demons in torment below. Lofty pines on the bank of the stream dwindle to shrubs in dizziness of distance. Everything beneath has a weird and deceptive appearance. The water does not look like water, but like oil. Numerous fishhawks are seen busily plying their vocation, sailing high above the waters, and yet a thousand feet below the spectator. In the clefts of the rocks, hundreds of feet down, bald eagles have their eyries, from which we can see them swooping still further into the depths to rob the ospreys of their hard-earned trout. It is grand, gloomy, and terrible; a solitude peopled with fantastic ideas; an empire of shadows and of turmoil.

The artist Thomas Moran as he appeared on the 1871 Yellowstone expedition.

Spurred on by these accounts, Hayden organized his Yellowstone expedition with the support of a \$40,000 appropriation from Congress. In early June 1871, a team of 34 men and 7 wagons set out from Ogden, Utah. Among the group were geologist and executive officer of the expedition, James Stevenson; mineralogist, A. C. Peale; topographer, Antoine Schoenborn; artists, Henry W. Elliott and Thomas Moran; and photographer, William H. Jackson. Moran and Jackson proved to be invaluable to the expedition; their paintings and photographs dramatically documented the unique characteristics of the area.

After several weeks of travel, the Hayden expedition reached Boettler's Ranch in the Yellowstone Valley. There they joined the Barlow-Heap military party of engineers and explorers; together they spent several weeks exploring the Upper Yellowstone. The results of the investigations were published as a Senate document which was later used in support of the establishment of Yellowstone National Park.

The Hayden/Barlow-Heap expedition departed from Boettler's Ranch on July 20, 1871. The wagons and extra supplies were abandoned at Boettler's, and the remaining gear was packed on mules. Progress was slow; their passage through the dense forest was impeded by numerous trees which had been felled by fire. Additional problems were posed by the possibility of an Indian attack or of someone becoming separated from the main party and lost in the wilderness.

The Yellowstone Basin proved to be an ideal open-air laboratory, containing an extraordinary variety of natural features and providing important clues to mountain-making and volcanic processes. The scientists accompanying the expedition found unique opportunities for observation and study.

Hayden recorded his thoughts as his party advanced up the river:

But the objects of the deepest interest in this region are the falls and the Grand Canyon (of the Yellowstone). I will attempt to convey some idea by a description, but it is only through the eye that the mind can gather anything like an

Typical interior of a northwest ranch in the 1870's.

Hayden Survey camp at Boettler's Ranch. Emigrant Peak is in the distance.

adequate conception of them. . . . But no language can do justice to the wonderful grandeur and beauty of the canyon below the Lower Falls; the very nearly vertical walls, slightly sloping down to the water's edge on either side, so that from the summit the river appears like a thread of silver foaming over its rocky bottom; the variegated colors of the sides, yellow, red, brown, white, all intermixed and shading into each other; the Gothic columns of every form standing out from the sides of the walls with greater variety and more striking colors than ever adorned a work of human art.

The Grand Canyon of the Yellowstone, from the Lower Falls.

Standing near the margin of the Lower Falls, and looking down the Canyon . . . with its sides 1,200 to 1,500 feet high, and decorated with the most brilliant colors that the human eye ever saw, with the rocks weathered into an almost unlimited variety of forms . . . the whole presents a picture that would be difficult to surpass in nature. From any point of view, the Upper Falls are most picturesque and striking. The entire volume of water seems to be, as it were, hurled off the precipice with the force which it has accumulated in the rapids above, so that the mass is detached into the most beautiful snow-white, bead-like drops, and as it strikes the rocky basin below, it shoots through the water with a sort of ricochet for the distance of 200 feet.

The Lower Falls of the Yellowstone.

The Upper Falls of the Yellowstone.

Crater of the Grotto Geyser.

Of the Yellowstone itself, he wrote: "The river, by its width, its beautiful curves, and easy flow, moves on down towards its wonderful precipices with a majestic motion that would charm the eye of an artist."

However, not all was majestic beauty, for there was also the power and mystery of the geysers and the grotesque forms of the hot mud springs. Describing a geyser that he named the Grotto, Hayden wrote:

A vast column of steam issues from a cavern in the side of the hill, with an opening about 5 feet in diameter. The roaring of the waters in the cavern, and the noise of the waves as they surge up to the mouth of the opening, are like that of the billows lashing the sea-shore. The water is as clear as crystal, and the steam is so hot that it is only when the breeze wafts it aside for a moment one can venture to take a look at the opening.

Located higher up on the side of the hill, not far from the Grotto, is the most remarkable mud-spring we have ever seen in the West. It may not improperly be called the Giants Caldron. It does not boil with an impulse like most of the mud-springs, but with a constant roar which shakes the ground for a considerable distance, and may be heard for half a mile. All the indications around this most remarkable caldron show it has broken out at a recent period . . .

Examining the mud springs and geysers was hazardous and could be a painful experience, as Hayden discovered:

The entire surface is perfectly bare of vegetation and hot, yielding in many places to slight pressure. I attempted to walk about among these simmering vents, and broke through to my knees, covering myself with hot mud, to my great pain and subsequent inconvenience.

Finally, the expedition reached Yellowstone Lake, the focal point of their exploration, causing Hayden to remark:

On the 28th of July we arrived at the lake, and pitched our camp on the northwest shore, in a beautiful grassy meadow or opening among the dense pines. The lake lay before us, a vast sheet of quiet water, of a most delicate ultramarine hue, one of the most beautiful scenes I have ever beheld. The entire party was filled with enthusiasm. The great object of all our labors had been reached, and we were amply paid for all our toils. Such a vision is worth a lifetime, and only one of such marvelous beauty will ever greet human eyes. From whatever point of view one may behold it, it presents a unique picture.

Boiling mud springs at Crater Hills.

Hayden's party split into groups, with some continuing to explore the perimeter of the lake, while Hayden, Schoenborn, and other members of the expedition went to the Geyser Basin of the Firehole River. Here, Hayden and his party examined several geysers and "boiling springs" and gave them names such as Thud Geyser, Mud Puff, Architectural Fountain, Catfish, Bathtub, Dental Cup, Punch Bowl No. 2, and Beehive. Impressed with the geologic spectacles, Hayden continued to record his scientific observations.

South of the Thud Geyser, as laid down on the chart, there is one large basin, 150 feet in diameter, with a crater within the rim 25 feet in diameter. From this an entire mass of water is thrown up 30 to 60 feet, falling back into it, in detached globules, like silver. There is a rim around the inner crater 3 feet high. The vast column of water as it shoots up, spreads out in falling back, like a natural fountain, so that it overflows the inner rim for a radius of 10 feet. A short distance

south of the Fountain Geyser is one of the most remarkable mud-pots in the Firehole Valley. The diameter within the rim is 40 to 60 feet, and forms a vast mortar-bed of finest material. The surface is covered with large puffs, and as each one bursts the mud spurts upward several feet with a suppressed thud. The mud is an impalpable, siliceous clay, fine enough, it would seem, for the manufacture of the choicest ware. The colors are of every shade, from the purest white to a bright, rich pink. The surface is covered with twenty or thirty of these puffs, which are bursting each second, tossing the mud in every direction on to the broad rounded rim. There are several other mud-puffs in the vicinity, but they do not differ materially from the last, except in size. Within a few feet of the mud-springs, there is a large clear spring, 40 to 60 feet, with perhaps fifty centers of ebullition, filled with the rusty leathery deposit, and all

around the basin where the waters overflow there is an extensive deposit of the iron. The temperature is  $140^{\circ}$ . About one-fourth of a mile west of the large mud-pots are some extensive fissure-springs, one of them 100 feet long and of variable width, 4 to 10 feet. These appear to be merely openings in the crust or deposit which covers the entire surface. Quite a large stream flows from this spring. Many of the springs seem to remain full to the rim of the crater, and are in a continual state of greater or less ebullition, and yet no water flows from them. Others discharge great quantities. The aggregate of the surplus water usually forms a good sized stream, as is shown on the map. In this group are a few springs that have precipitated a small amount of sulphur, the first observed in the Firehole Valley. Silica and iron seem to be the dominant constituent in nearly all the deposits. There are numerous springs that deposit a curious black sediment like fine gunpowder, and send forth a very disagreeable odor.

Mud geysers in action.

Crater Fountain Geyser, Lower Firehole Basin.

Continuing the exploration, some members performed detailed surveys and others pushed into the valley of the Upper Yellowstone River. They traversed the East Fork of the river, and ascended Mounts Doane and Stevenson. Eventually, after spending 38 days in the wilderness, the entire party returned to Boettler's Ranch. There they packed their wagons and retraced their route to Fort Hall. They traveled eastward aboard the Union Pacific Railroad to Evanston, Illinois, where the party disbanded on October 1, 1871.

In addition to Jackson's photos, an important product of the expedition was a 500-page report by Hayden detailing the findings of his party. Hayden presented this report, Jackson's photos, and Moran's sketches and paintings to Senators, Congressmen, his superiors in the

Department of the Interior, and nearly everyone else who could possibly influence the founding of a park. He also published articles in magazines with national circulation and spent much personal time and effort trying to convince Congress to establish the park.

On December 18, 1871, a bill was introduced simultaneously in the Senate, by Senator S. C. Pomeroy of Kansas, and in the House of Representatives, by Congressman W. H. Claggett of Montana, for the establishment of a park at the headwaters of the Yellowstone River. The bill was referred to the respective Committees on Public Lands. Upon reporting the bill back to the Senate on January 22, 1872, Senator Pomeroy advised that body, "Professor Hayden and party have been there, and this bill is drawn on the recommendation of that gentleman to consecrate for public uses this country for a public park."

In his published report to Secretary C. Delano of the Department of the Interior, Hayden urged final passage of the bill:

I have thus presented a brief history of the passage of this bill because I believe it will mark an era in the popular advancement of scientific thought, not only in this country, but throughout the civilized world.

That our legislators, at a time when public opinion is so strong against appropriating the public domain for any purpose however laudable, should reserve, for the benefit and instruction of the people, a tract of 3,578 square miles, is an act that should cause universal joy throughout the land. This noble deed may be regarded as a tribute from our legislators to science, and the gratitude of the nation and of men of science in all parts of the world is due them for this munificent donation.

An 1863 photograph of William H. Claggett, a member of the Nevada Territorial Legislature; Mark Twain, then a reporter covering legislature affairs; and A. J. (Jack) Simmons, Speaker of the House. Eight years after this photograph was taken, Claggett introduced the Yellowstone National Park Bill in the U. S. House of Representatives.

Devils Slide of Cinnabar Mountain, 10 miles above the second canyon, Yellowstone National Park area. Figures in the photo are Henry W. Elliott, sketching, and Thomas Moran, looking over Elliott's shoulder.

Hayden's influence on Congress is apparent in the detailed information contained in the report of the House Committee on Public Lands:

The bill now before Congress has for its object the withdrawal from settlement, occupancy, or sale, under the laws of the United States a tract of land fifty-five by sixty-five miles, about the sources of the Yellowstone and Missouri Rivers, and dedicates and sets it apart as a great national park or pleasure-ground for the benefit and enjoyment of the people. The entire area comprised within the limits of the reservation contemplated in this bill is not susceptible of cultivation with any degree of certainty, and the winters

A hot spring cone entirely surrounded by the clear, cool water of Yellowstone Lake. In the center of the cone is a spring of boiling water. A fisherman may stand on the cone, extend a rod into the lake, catch a trout, and cook it in the boiling spring without taking it from the hook.

Map of Yellowstone National Park and vicinity, 1871. This map was included in the Hayden report to the Secretary of the Interior.

would be too severe for stock-raising. Whenever the altitude of the mountain districts exceeds 6,000 feet above tide-water, their settlement becomes problematical unless there are valuable mines to attract people. The entire area within the limits of the proposed reservation is over 6,000 feet in altitude and the Yellowstone Lake, which occupies an area fifteen by twenty-two miles, or three hundred and thirty square miles, 7,427 feet. The ranges of mountains that hem the valleys in on every side rise to the height of 10,000 and 12,000 feet, and are covered with snow all the year. These mountains are all of volcanic origin, and it is not probable that any mines or minerals of value will ever be found there. During the months of June, July, and August the climate is pure and most invigorating, with scarcely any rain or storms of any kind, but the thermometer frequently sinks as low as 26°. There is frost every month of the year. This

J. Bien, photo lith.

Camp on Mystic Lake.

whole region was, in comparatively modern geological times, the scene of the most wonderful volcanic activity of any portion of our country. The hot springs and the geysers represent the last stages—the vents or escape pipes—of these remarkable volcanic manifestations of the internal forces. All these springs are adorned with decorations more beautiful than human art ever conceived, and which have required thousands of years for the cunning hand of nature to form. Persons are now waiting for the spring to open to enter in and take possession of these remarkable curiosities, to make merchandise of these beautiful specimens, to fence in these rare wonders, so as to charge visitors a fee, as is now done at Niagara Falls, for the sight of that which ought to be as free as the air or water.

In a few years this region will be a place of resort for all classes of people from all portions of the world. The geysers of Iceland, which have been objects of interest for the scientific men and travelers of the entire world, sink into insignificance in comparison with the hot springs of the Yellowstone and Firehole Basins. As a place of resort for invalids, it will not be excelled by any portion of the world. If this bill fails to become a law this session, the vandals who are now waiting to enter into this wonderland will, in a single season, despoil, beyond recovery, these remarkable curiosities, which

Camp study of the Hayden Survey, 1871. The figures in the photo are: F. V. Hayden (seated) and Walter Paris.

have required all the cunning skill of nature thousands of years to prepare.

We have already shown that no portion of this tract can ever be made available for agricultural or mining purposes. Even if the altitude and the climate would permit the country to be made available, not over fifty square miles of the entire area could ever be settled. The valleys are all narrow, hemmed in by high volcanic mountains like gigantic walls.

The withdrawal of this tract, therefore, from sale or settlement takes nothing from the value of the public domain, and is no pecuniary loss to the government, but will be regarded by the entire civilized world as a step of progress and honor to Congress and the nation.

When the bill was presented to Congress, discussion focused on the suitability of the land for agricultural development. The bill's chief supporters convinced their colleagues that the region's real value was as a park area, to be preserved in its natural state. The bill was approved by a comfortable margin in the Senate on January 30, 1872, and by the House on February 27.

On March 1, President Grant signed the bill into law, establishing the Yellowstone region as a public park and setting a major conservation precedent. The Nation had its first national park; an area of exceptional beauty was set aside for the enjoyment of generations to come, and a tradition of preserving similar areas was established.

# Forty-second Congress of the United States of America;

At the Second Session,

Begun and held at the City of Washington, on Monday, the Fourth day of December, one thousand eight hundred and seventy-one.

## AN ACT

To set apart a certain tract of land lying near the head-waters of the Yellowstone River as a public park.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,

That the tract of land in the Territories of Montana and Wyoming, lying near the head-waters of the Yellowstone River, and described as follows, to wit, commencing at the junction of Gardiner's River with the Yellowstone River, and running east to the meridian passing ten miles to the eastward of the most eastern point of — Yellowstone Lake; thence south along said meridian to the parallel of latitude passing ten miles south of the most southern point of Yellowstone Lake; thence west along said parallel to the meridian passing fifteen miles west of the most western point of Madison Lake; thence north along said meridian to the latitude of the junction of the Yellowstone and Gardiner's Rivers; thence east to the place of beginning is hereby reserved and withdrawn from settlement, occupancy, or sale under the laws of the United States, and dedicated and set apart as a public park or pleasure-ground for the benefit and enjoyment of the people; and all persons who shall locate or settle upon or occupy the same, or any part thereof, except as hereinafter provided, shall be considered trespassers, and removed therefrom. Sec. 2 That said public park shall be under the exclusive control of the Secretary of the Interior, whose duty it shall be, as soon as practicable, to make and publish such rules and regulations as he may deem necessary or proper for the care and management of the same. Such regulations shall provide for the preservation, from injury or spoliation, of all timber, mineral deposits, natural curiosities, or wonders within said park, and their retention in their natural condition. The Secretary may, in his discretion, grant leases for building purposes for terms not exceeding ten years, of small parcels of ground, at such places in said park as shall require the erection of buildings for the accommodation of visitors; all of the proceeds of said leases, and all other revenues that may be derived from any source connected with said park, to be expended under his direction in the management of the same, and the construction of roads and bridle-paths therein. He shall provide against the wanton destruction of the fish and game found within said park, and against their capture or destruction for the purposes of merchandise or profit. He shall also cause all persons trespassing upon the same

after the passage of this act to be removed therefrom, and generally shall be authorized to take all such measures as shall be necessary or proper to fully carry out the objects and purposes of this act.

## ABOUT THE ILLUSTRATIONS IN THIS PUBLICATION

The illustrations used in this publication are, principally, reproductions of photographs taken by William Henry Jackson and of pen-and-ink sketches by Thomas Moran, both of whom accompanied Hayden on his Yellowstone expedition in 1871. Jackson, considered by many to be the foremost photographer of the early West, was among the first to photograph the Yellowstone area. In 1873, 37 of Jackson's photographs were published for the first time by the Interior Department in "Photographs of the Yellowstone National Park and Views of the Montana and Wyoming Territories." Jackson's own captions describe a selection of these photos on the following pages.

Moran's equally famous sketches and paintings sparked the interest of Government officials as well as the general public. One of his landscapes (presented on page 3 of this booklet) hung for many years in the Halls of Congress. Moran was fascinated by Jackson's work and at times selected the subject matter of the photographs. Often he set up his easel nearby, and the men shared ideas as they worked.

Jackson's photographs were considered by many to be the most important contribution of the 1871 expedition. Their practical value was enhanced because they were the only available photos of the Yellowstone area. J. Crissman, a local free-lance photographer who used a camera borrowed from Jackson, never made any real use of his photos outside of the Montana area. T. J. Hines, a photographer with the Barlow-Heap expedition, had all his negatives destroyed in the Great Chicago Fire, on October 8, 1871.

The value of Jackson's photographs was acknowledged by Hayden in his report to the Secretary:

Mr. William H. Jackson performed his duties with great zeal, and the results of his labors have been and will continue to be of the highest value. During the season he obtained nearly 400 negatives of the remarkable scenery of the routes, as well as the canyon, falls, lakes, geysers, and hot springs of the Yellowstone Basin, and they have proved, since our return, of very great value in the preparation of the maps and report.

But, perhaps the most fitting testimonial of Jackson's contribution to the Yellowstone expeditions was offered by a former Director of the National Park Service, Arno B. Cammerer, who said:

It was a singular stroke of fortune that the Hayden Expedition took with it to the Yellowstone land of miracles, the miracle of photography. The camera, in the hands of William H. Jackson, recorded for the first time the phenomena of the Yellowstone in a form that the most skeptical human eye could not dispute. These photographs helped as much as anything to convince Congress that the Yellowstone region should be set aside as a National Park.

Center—William Henry Jackson, studio portrait, 1873. Upper left—W. H. Jackson in the field, self-portrait. Upper right—Photographing in high places—the Tetons. Jackson is shown squatting over his wet-plate equipment while an assistant (Campbell ) stands by. 1873.

Camp of U.S. Geological Survey, Ogden, Utah. The camp is located on one of the remarkable lake-terraces which form an interesting feature of the scenery on the Salt Lake Basin. The Wasatch Mountains, in the background, are about five thousand feet above the camp, and nine thousand five hundred and thirty feet above sea level.

Meeting of the U.S. Geological Survey in the Lower Firehole Basin. The two divisions of the Survey met at this locality on the same day, July 17, 1872, starting from this point several hundred miles distant from each other. The locality is near the source of the Madison River, and is within the limits of the National Park, Latitude  $44^{\circ}36'6''$ ; Longitude  $110^{\circ}55'15''$ .

Mt. Hayden, or the Great Teton. This picture represents one of the monarch peaks of the Rocky Mountains. It is visible on a clear day for a radius of one hundred and fifty miles in every direction, thus forming one of the most conspicuous landmarks in the West. It is probable that the only white men that ever reached its summit are Mr. James Stevenson and Hon. N. P. Langford. The elevation is thirteen thousand four hundred feet. It is seen by the traveler on the overland stageroad to Montana, from the Snake River Basin, far to the eastward, rearing its "Bald awful head" far above the limit of perpetual snow.

Camp at the Mouth of Teton Canyon. This camp is in the Teton Canyon, and West of the Teton Range, just ten miles by Triangulation to the summit of the Grand Teton. The trees are all pines and firs. As the sun rises in the morning immediately back of the peaks, it invests them with remarkable beauty. The scenery along the Teton River is rugged and most attractive. It furnished some of the finest views taken on the Survey.

Crater of the Architectural Geysers, Lower Basins. This picture represents one of the handsomest fountain springs in the Lower Basin. The entire mass of the water is at times most violently agitated, and is thrown up by a succession of impulses forty to sixty feet. The water overflowing the borders and producing the wonderful ornamentation which is so clearly shown in the photograph. The peculiar coral-form masses of pearly silica are well brought out. The crater is about twenty-five feet in diameter, and the water when quiet has a temperature of about  $180^{\circ}$ .

Upper Firehole Basin from the Crater of Old Faithful. Old Faithful derived its name from the regularity of its action, which occurs once in sixty-five minutes. When it is in operation it throws a column of water, by a succession of impulses six feet in diameter, to the height of one hundred and sixty feet. The paroxysm continues about twelve minutes when the water sinks down in the crater, and all is quiet. The siliceous deposits around the crater are marvels of beauty. The Madison River can be seen in the distance, and also the geysers in operation.

Mammoth Hot Springs on Gardiner's River. The peculiar character of the deposits is well shown in this picture. The larger hot springs are located on the terrace above, and, as the heated water flows over the declivity, the beautiful pool-like basins are formed from four to eight feet wide and two to four feet deep. As the water leaves the spring and flows over the sides of the mountain, it loses a portion of its heat, so that the bather may choose any temperature he may desire. These pools are sometimes called Diana's Baths. The deposit is as white as snow.

Mammoth Hot Springs, Lower Basin. There are two kinds of hot springs in the park, called siliceous and calcareous from the character of their deposits. A large amount of lime is held in solution in the hot water which is precipitated in wonderfully unique architectural forms on the steep sides of the mountains, as shown in the photograph. These springs are located in the valley of the Yellowstone, near the northern boundary of the park, and are named White Mountain Hot Springs on the map. At the present time they are most accessible by way of Fort Ellis, Montana, and the Yellowstone Valley.

Lower Falls of the Yellowstone. About a fourth of a mile below the Upper Falls, the waters of the Yellowstone take a much more fearful leap, making a clear descent of three hundred and fifty feet. There is probably not a more beautiful sight in existence than the falls with the Grand Canyon below. The rocks are mostly volcanic.

Lower Falls of the Yellowstone. A more distant view of the falls. The photograph however, conveys but a dim conception of the ruggedness of the surroundings.

Cap of Liberty Mammoth Hot Springs. This is a fine example of an extinct geyser or fountain spring. It doubtless operates much like one of our artificial fountains, throwing up a column of water several feet, by a succession of impulses, building up a cone by over-lapping layers of lime, like the thatch on the roof. The cone is forty-two feet high and about twenty-five feet in diameter at its base. When the hydrostatic force begins to abate, the cone is gradually closed up at the summit, as is shown in the photograph. These dead springs or geysers are a common feature in the park, and are called, in the language of Iceland a "laug." It is only a calcareous spring that can form so curious and lofty a cone as this.

Tower Falls. These beautiful falls are located on a little branch of the Yellowstone, which flows in from the west side, near the lower end of the Grand Canyon. The descent of the water is about one hundred and fifty feet. The rocks are composed of a peculiar conglomerate, which has been weathered into most fantastic, pointed columns resembling the towers of a gothic cathedral. Hence the name.

Panoramic View of the Valley of the Yellowstone. This is one of three pictures that form a panoramic view of what is regarded by visitors to that region as the most beautiful and symmetrical range of mountains in America. The summits of the peaks are covered with snow more or less the year round, and can be seen for eighty to one hundred miles in every direction.

The Grand Canyon, One Mile Below the Falls. This picture is intended to convey to the eye some idea of the depth and remarkable ruggedness of the Canyon. To one standing on the margin of the Canyon, the Yellowstone River fades to a slender thread as it flows along the bottom of the chasm.

Hot Springs and Castle Geyser. The spring in the foreground is in all respects the most beautiful one in the National Park. The ornamental rim is nearly circular, being about twenty-two feet. The depth is unknown. When the rays of the sun fall nearly vertically on the almost unnaturally transparent waters, all the colors of the prism are produced. The temperature is about  $180^{\circ}$ . Just in the background is the Castle Geyser, which is so called from the form of its crater. It is really an old ruin. It seldom plays, but when in operation it is terrific power, shaking the ground for a considerable distance. It continues with great force for one to two hours.

Panoramic View of the Teton Range. This photo presents a panoramic view of the north portion of the Teton Range. The peaks in the distance are composed of massive granites, while the rocks in the foreground are limestones.

Crater of the Deluge Geyser, Red Mountain Basin. The crater of Deluge Geyser reminds one with its irregular shape of a clover leaf. The water temperature is about  $160^{\circ}$  and when it erupts it throws its water out in a powerful deluge.

Mystic Lake, Source of East Gallatin. In the range of mountains that separate the waters of the Missouri and Yellowstone, south of Fort Ellis and Bozeman and the upper end of the Gallatin Valley, are some of the finest scenery in Montana. Mystic Lake is a gem set among the mountains and gives origin to one of the main branches of the Gallatin River. It is full of trout and is a place of resort for fishermen. It is located about twelve miles southeast of Fort Ellis.

**Index map of Yellowstone National Park**

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.
