

## **Threatened and Endangered Species and Vital Signs Monitoring**

**ROLE OF THREATENED AND ENDANGERED SPECIES:** Endangered and threatened species present unique management challenges for the National Park Service (NPS). The Endangered Species Act specifically identifies the National Park Service as having additional responsibilities for protecting and recovering listed species. Listed species frequently require special management with a single species or a single habitat receiving priority consideration within an ecosystem management concept. These special management requirements provide NPS with an opportunity to take the lead or assist in the restoration of our Nation's rarest plants and animals.

**NPS POLICIES ON MONITORING T&E SPECIES AND CRITICAL HABITAT:** NPS Management Policies and directives prescribe management of endangered, threatened, and candidate species in conformance with the ESA, recovery plans, and other related documents. With respect to monitoring, these documents state that NPS will:

- Inventory, monitor, and manage all federally listed, candidate, and sensitive species. This includes mapping species' distribution in the park, identifying critical habitat (if any), and determining numbers of individuals, threats to the species, source of threats, and population condition and trends.
- Inventory, monitor, and manage state and locally listed species in a manner similar to its treatment of federally listed species, to the greatest extent possible. In addition, the Service will inventory other native species that are of special management concern to parks (such as rare, declining, sensitive, or unique species and their habitats) and will manage them to maintain their natural distribution and abundance.
- Restore listed species to their historic range wherever feasible, consistent with recovery plan objectives.
- Coordinate management and monitoring programs with other federal and state agencies and adjacent private landowners where habitat and species restoration is critical to the recovery of listed species.
- Inventories and periodic monitoring should be accomplished to provide data to direct and evaluate the success of recovery actions. Monitoring methods should be consistent with the recovery plan and other procedures adopted by the FWS/NMFS for that particular species. Monitoring reports should be prepared and provided to the NPS regional and Washington offices' threatened and endangered species coordinators and to the FWS/NMFS.

## EXISTING REPORTING REQUIREMENTS FOR NPS T&E SPECIES:

**T&E Program Annual Reports:** The U.S. Fish and Wildlife Service (FWS) annually requests information from all federal agencies (including NPS) on the status of listed species (if they are improving, declining, stable, unknown, or extirpated) and the amount of funds expended on each species. The National Endangered Species Coordinator is required to compile an annual report on NPS funds expended service-wide for listed species in parks, which is then provided to the FWS. Data for this report comes from annual regional reports prepared by the Regional T&E Coordinators. Their report on T&E species should include inventory and monitoring efforts, research, population status reports, threat identification, and funds expended.

**GPRA Related:** The 2001-2005 Strategic Plan for the NPS identifies the protection of endangered species as an important goal. Individual park units are required to annually document the status of listed species (if they are improving, declining, stable, unknown, or extirpated), estimate future funding/FTEs on these species, and document actual funding/FTEs on these species.

**NPS Consolidated database:** In an effort to streamline reporting related to the above activities, the BRMD is assembling a consolidated database that will hopefully fulfill the data needs of both internal and external data requests. Parks will be asked to annually provide the following information on each listed species known from the park:

- Species (scientific name; from NPSpecies)
- Status within the Park (Not At-Risk; At-Risk Stable; At-Risk Improving; At-Risk Declining; Extirpated; Unknown)
- How status was determined (Literature; Species-specific monitoring effort; Expert panel; Professional judgment, Other)
- Estimated Park expenditures for fiscal year (thousands of dollars)
- Actual Park expenditures for fiscal year (thousands of dollars)
- Estimated Park FTE for fiscal year
- Actual Park FTE for fiscal year

**MONITORING STRATEGIES FOR T&E SPECIES:** Monitoring is most effective when it is clearly tied to management needs – when it specifically seeks to provide information needed to influence management decisions. While the protection and recovery of threatened and endangered species are important management considerations to national parks, there is not enough available funding to intensively monitor all populations of all listed species within all national parks. So, how much monitoring effort should be devoted to threatened and endangered species? To answer this, we need to first explore three related questions:

- *How will data from monitoring influence management of the species or the park?*  
If monitoring a species provides data that has significant ramifications on park management options, it is probably important to have a strong, scientifically rigorous monitoring effort. As monitoring results become more influential or controversial, the more important that the monitoring program is defensible. It is

important that we monitor species because we need data on that species rather than because we have a personal interest in that species.

- *How sensitive must monitoring be to detect changes in species or habitats (acceptable or unacceptable changes)?* Vital Signs monitoring is intended to “take the pulse” of national parks and provide an “early warning” to managers that something has changed – for better or worse. It does not have to identify the cause of that change. Thus, you need to decide on thresholds of change – how much resolution do you need. If you need to detect minute annual changes in reproductive output, then you probably will need to pursue an intensive detailed monitoring study. If you only need to know that the species or habitat is still present in good numbers (stable), you may just need to undertake less intensive surveys to reassure yourself that the current view of the situation has not changed unacceptably. If the park is critical to the survival of the species, the consequences of not detecting a species decline in your park is probably more significant than for species like the bald eagle which is found in many parks.
- *What are the consequences of not monitoring, too little monitoring, or over monitoring one species at the expense of another?* What happens if we do not monitor a species? Is there a risk that the species will decline suddenly while we are not looking? If there is a decline, is it important to stop it immediately, or is there time to act more slowly? If we monitor intensively every three years, with low-intensity annual check ups, is that good enough to keep track of the situation? What happens if we put all of our monitoring effort on only a few species? Do we get a better picture of a park’s health by low-intensity monitoring of many species or by intensive monitoring of only a few species?

So, let’s now look back at the original question of how monitoring effort should be devoted to threatened and endangered species? As a minimum, parks will annually need to provide their best assessment of the status of each federally listed threatened and endangered species. In many instances, low-intensity monitoring of these species will probably allow park staff to answer that question – to estimate if a species is at-risk or not at-risk within the park and if the species appears to be stable, declining, or increasing in the park. However, if a park has specific management actions on a species, a finer resolution result may be needed. In these cases, more intensive monitoring may be warranted. Local endemics are probably more important to monitor intensively than are widespread species, especially if the endemics are not abundant.

We suggest that in many instances, it is more important to monitor all listed species than it is to monitor only a few species intensively. Vital Signs is an early warning system and one of the best evaluators of how well a species is doing is a biologist in the field making personal observations.

## ASSISTANCE WITH T&E SPECIES

### NPS National Endangered Species Program

Biological Resource Management Division  
1201 Oak Ridge Drive, Fort Collins, CO 80525

*Endangered Species Program Manager:* Loyal A. Mehrhoff (970-225-3521)

*Endangered Species Specialist (animals):* Peter A. Dratch (970-225-3596)

National Capital Region: Diane Pavek (202-342-1443)

Northeast Region: Michele Batcheller (814-863-9414)

Southeast Region: Sheila Colwell (404-562-3113)

### Midwest Region:

Julie Stumpf – plants (219-926-7561)

Dan Licht – animals (402-221-3603)

Intermountain Region: Laura Hudson (303-969-2518)

### Pacific West Region

Jonathon Bayless – south (510-817-1427)

Steve Gibbons – north (206-220-4105)

Alaska Region: Terry DeBruyn (907-257-2564)

## KEY CATEGORIES OF SPECIES:

**Federally Endangered:** Any species that is in danger of extinction throughout all or a significant portion of its range.

**Federally Threatened:** Any species that is likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range.

**Federal Experimental:** Any population of a listed species (including subsequent progeny) artificially established outside the current range of the species but within probable historical habitat in order to further the listed species' conservation under section 10(j) of the ESA. An "essential experimental population" is a reintroduced population whose loss would be likely to appreciably reduce the likelihood of the survival of the species in the wild. A "nonessential experimental population" is a reintroduced population whose loss would not be likely to appreciably reduce the likelihood of survival of the species in the wild. Critical habitat may be designated for essential experimental populations but not for nonessential experimental populations. Any essential or nonessential experimental population located within an NPS unit is treated as a threatened species.

**Federal Similarity of Appearance:** If a species so closely resembles a species that has been listed so that enforcement personnel would have substantial difficulty in attempting to differentiate between the listed and unlisted species, the Secretary of Interior may, by regulation of commerce or taking, treat any species as an endangered species or threatened species.

**Federal proposed species:** Any species of fish, wildlife, or plant that is proposed in the *Federal Register* to be listed under Section 4 of the ESA. Federal agencies must confer with the FWS/NMFS when actions may jeopardize proposed species.

**Federal candidate species:** *Candidate species:* Candidate species are those plant and animal species for which the U.S. Fish and Wildlife Service (FWS) and National Marine Fisheries Service (NMFS) have sufficient information on the biological status and threats to the species to propose for listing as endangered or threatened under the ESA. An annual notice of review prepared by the FWS /NMFS and published in the *Federal Register* provides an updated list of candidate species and solicits new information on the biology, status, and distribution of any candidate species that could result in a reevaluation of the species status. Candidate species receive no statutory protection under the ESA.

**Federal Species of Concern:** Any species of fish, wildlife, or plant where all or a significant portion of its range has become restricted or limited. This designation does not necessarily imply that populations of the species are significantly reduced or threatened with reduction. No legally required federal protection is associated with this designation.

**State and locally listed species:** Species identified and/or afforded protection under any number of state or local laws.

APPENDIX: Draft T&E Database (8/17/2001)

COLUMN INFORMATION:

ID Codes for species and populations from US Fish and Wildlife Service database

Names, scientific and common

Region the park is located in

Park code

Status of the "species" within the park.

Historic

Current

Potential

Cultivated/captive

Listing Information: ESA code for species/population

E: Endangered

T: Threatened

P: Proposed

SAT: Similarity of Appearance

C: Candidate for listing

SOC: Species of Concern

Listing Date

Critical Habitat: citation for designation in the CFR

Critical Habitat Date

NPS?: Is Critical Habitat designated within the park?

Recovery Plan Information: Plan Name

Recovery Plan date of final plan

Tasks?: Are there Recovery Plan tasks for NPS?

GPRA Information

Ia2: Is this species reported under GPRA goal Ia2?

Ia02: Is this species reported under GPRA goal Ia02?

FY2000 Information:

Trend:

Not at-risk in park

At-risk, stable

At-risk, improving

At-risk, declining

Extirpated within park

Unknown status

Costs: Total amount spent on the species in FY

Data: How was trend determination made:

Literature

Species-specific monitoring effort

Expert panel

Professional judgment

Other
