

# The National Park Service Comprehensive Survey of the American Public

## Pacific West Region Technical Report

August 2002

**NPS Social  
Science Program**

**Social Research Laboratory  
Northern Arizona University**

## INTRODUCTION

This Pacific West Region (PWR) Technical Report is one of seven regional technical reports produced from findings of a national survey of the American public conducted by the United States National Park Service and the Social Research Laboratory of Northern Arizona University. The national study is the first effort in several decades by the National Park Service to comprehensively survey the American public and understand the relationship the public has with the national system of parks, historic and cultural sites, and monuments. Information in this report reflects the attitudes, opinions, interests, and visitation patterns of a representative sample of adults living in the United States. Each of the regional technical reports compares regional data with national data on each topic.

This report includes a comparison of information drawn from the Pacific West Region with national information. All items within the national technical report published in Spring 2001 are included in this report. A broad overview of the national data can be obtained from the *National Park Service Comprehensive Survey of the American Public: Technical Report*, now available from the NPS Web Site (Social Science Program) at <http://www.nps.gov/socialscience/waso/products.htm#TA>. A statistical analysis of differences between the PWR regional data and national data are included in this report.

The data summary tables contained in this report illustrate patterns in visitation and non-visitiation of National Park Service units in the United States. Demographic differences between Park System unit visitor and non-visitor populations are outlined in this report, as well as differences in motivation, interest, and attitudes within these populations. Research presented in this report provides perspective on barriers that limit more frequent visitation of Park System units, future usage patterns of National Park Service units, fee management issues, the public image of the National Park Service and National Park System, and opinions about specific natural resource management policies. In all cases, data related to the Pacific West Region reflects information from residents of the regional population, rather than from visitors to the parks within specific regions.

## **METHODOLOGY**

The National Park Service commissioned the Social Research Laboratory at Northern Arizona University to conduct the agency's first comprehensive survey of the American public. Information was collected from a random sample of adult respondents living in the United States to provide a national perspective of people's relationships with the National Park Service and National Park System units. Two datasets were constructed from the collected information: a national dataset reflecting attitudes, opinions, and behaviors of the adult population of the United States and a regional dataset that allows for comparisons of information between the national data and data from the seven National Park Service regions. For purposes of this research, a National Park System visitor is defined as an individual who has entered a National Park System unit within the previous twenty-four months of being contacted for this survey and is able to accurately identify the unit they entered. Unit names were verified against a list of units provided by the National Park Service. National Park Service employees and members of their immediate family were not included in this survey.

Survey data were obtained by interviewing adult members of 3,515 households in the United States. Respondents were randomly selected in the household using a procedure whereby the interviewer speaks to the adult living within the household who has had the most recent birthday. This procedure is well accepted within the social sciences as a reliable method for randomly selecting survey respondents. The original sample frame was purchased from Genesys Marketing Systems of Fort Washington, Pennsylvania. The sample frame was constructed using standard Random Digit Dialing (RDD) procedures and purged for nonworking telephones and business lines. Data collection was completed between February 21, 2000, and May 21, 2000.

### **Survey Limitations**

All survey research statistics are subject to sampling errors as well as non-sampling errors such as survey design flaws, reporting errors, data processing mistakes, and undercoverage. The Social Research Laboratory has taken steps to minimize errors by implementing quality control procedures to reduce errors made by respondents, interviewers, and coders. Ratio-estimation to independent age-gender-race-ethnicity population controls partially corrects for bias attributable

to survey undercoverage. However, biases in the estimates are unavoidable when missed people have characteristics different from those of interviewed people in the same age-gender-race-ethnicity group.

Table I-1 reports the completion rate for the survey in the Pacific West Region. The completion rate for the Pacific West Region was 95 percent, and the completion rate for the national study was 88 percent. For a study of this scope and magnitude, completion rates of 95 percent and 88 percent suggest high validity of survey results. Table I-2 reports the number of unweighted and weighted surveys included in the respective datasets. Weighted survey totals are derived after the ratio-estimation model is applied to the data. Because different ratio-estimation models have been applied to the national and regional data sets, the total number of weighted cases varies between the two datasets.

<b>Table I-1: Completion Rates</b>		
	Pacific West Region	National Average
Completion Rates	95%	88%

<b>Table I-2: Number of Surveys</b>		
	Pacific West Region	National Data
Unweighted	502	3515
Weighted	503	3515

The margin of error associated with national-level data in this study is +/- 1.7 percent at a 95 percent confidence level. The margin of error associated with data from each of the National Park Service Regions in this study is +/- 4.5 percent at a 95 percent confidence level. “Margin of error” is a statistical term that describes the probable difference between interviewing everyone in a given population and interviewing a sample drawn from that population. The percentages obtained in telephone surveys are estimates of what the percentage would be if the entire population had been surveyed. Thus, if 50 percent of those in the sample are found to agree with a particular statement and the associated margin of error is +/- 4.5 percent, the actual percentage of agreement in the population from which the sample is drawn would be between 45.5 percent and 54.5 percent (50% +/- 4.5%). The 95 percent confidence level means that this +/- 4.5 percent “margin of error” would occur in 95 out of 100 samples of this size drawn. Sampling error increases as sample size is reduced. This must be kept in mind when comparing the responses of subgroups within the sample (e.g. men vs. women). Smaller numbers of respondents on any question translate into higher margins of error.

For this survey, a comprehensive list of National Park System units was provided by the National Park Service and used to verify that respondents actually visited a National Park System unit within the past two years. Fourteen System units were inadvertently omitted from this list. After thorough review, these missing units were determined to be low-visitation units. The impact of their omission is insignificant to the larger goal of determining the proportion of the American public that had visited a National Park System unit within the previous two years. In addition, a small number of units listed by respondents were later determined to be park headquarters or offices. Thirteen respondents out of 3,515 named these units as the location of their last visit. The impact of their classification as visitors is also insignificant to the larger goals of the research project.

## Table Reading

Information is reported in frequency crosstabulation tables associated with each survey question. Tables are introduced with a reference label (e.g., Table IV-2) and a descriptor indicating the pertinent population (e.g., general public, recent visitor, national data, regional data). Each table also contains a vertical and horizontal axis. Axes are labeled to indicate the specific populations being referenced (e.g., visitors or non-visitors).

Data in the crosstabulation tables are presented in column percent format and demographic information is presented in frequency table format. Independent variables are presented at the top of the crosstabulation tables. Each condition of the independent variable is treated as a discrete whole unit within each column. For example, with visitors and non-visitors, the total population of visitors is compared against the total population of non-visitors. If looking at the question “What comes to mind when you hear the words “National Park System?” the reader would compare the proportion of all visitors who said “beauty” against the proportion of all non-visitors who said “beauty.” Thus, while columns total 100 percent vertically, analytical comparisons are made horizontally across columns.

Table data may not total 100 percent due to data being merged and rounded for reporting purposes. Additionally, some questions allowed the respondent to select more than one answer. For these multiple response questions, the total number of responses is greater than the number of respondents and the total percentage is greater than 100 percent.

As a way of statistically understanding whether perceived differences between national and regional data are actual, a chi-square test of significance was applied to each comparison of regional and national data (when applicable). This statistical test compares the regional (observed) and national (expected) frequencies in each category to determine if responses are distributed across the range of options in similar or dissimilar ways.

A statistically significant difference between datasets occurs when the chi-square test determines that it is reasonable to assume that perceived differences between the regional and national

information are actual, rather than a random anomaly of the data collection process. Social scientists are comfortable saying that differences are real when a statistical test yields results that would be similar 95 out of every 100 times data are collected. This level of certainty is noted by a single asterisk within table labels (\*). If an asterisk appears within a label, table readers should know that observed differences in the regional and national level information are significant, and therefore can be used reliably and accurately in future policy decisions.

When cell counts fall below five ( $N < 5$ ), application of the chi-square test of significance is not as reliable as preferred. This situation is noted by an “a” in the table label. In these circumstances, table readers should assume that despite an asterisk, results from the chi square test of significance cannot be used with the same degree of certainty. This is not the same as saying that perceived differences between the regional and national data should be assumed to not exist. Differences exist, but the significance of these differences cannot be reliably described. In cases where the chi-square test is not applicable, a “b” is placed next to the table label. The reader is solely reliant on their own interpretations of the data in these situations. Tables with no asterisks and no italicized letters reflect situations where a chi-square test was run and no significant difference between the regional and national data was found despite an adequate number of observations in each cell. Thus, although differences in regional and national data may be perceived, these differences should not become the basis for future policy decisions.

To review:

- \* *Statistically significant information.*
- a* *Chi-square test may not be stable due to small counts in one or more cells.*
- b* *Chi-square test not applied.*

Where there is no notation in a table heading, the chi-square test was applied and differences within the data are not statistically significant.

The following table is an example of the tables found in the technical report.

**Table 2.1 (Non-visitor) \* ,<sup>a</sup>**

	<b>PWR</b>	<b>National</b>
Yes	84%	68%
No	13%	27%
Don't know	3%	6%
<b>Total</b>	<b>100%</b>	<b>100%</b>
<b>Total N</b>	<b>N = 106</b>	<b>N = 1671</b>

In this example, observed differences between the distribution of data in the PWR region and national data are found to be significant. However, due to the small number of cases in at least one cell of the table ( $N < 5$ ), the chi-square test of significance is not as reliable as one would like. In this situation, the table reader is dependent upon their own interpretations of differences within the data with no external check on the quality of the data itself. Interpretations of this data are not as reliable and generalizable to the larger population as those that have a statistically significant difference.

## **Principal Investigators**

Dr. Frederic I. Solop, Director of the Social Research Laboratory at Northern Arizona University, served as principal investigator for this project. Dr. Solop was assisted in the research by co-principal investigator Ms. Kristi K. Hagen, M.A., M.A., Research Operations Manager of the Social Research Laboratory. The Social Research Laboratory (SRL) is a full-service research and teaching facility located within the College of Social and Behavioral Sciences, Northern Arizona University. The SRL offers quality research services to public and nonprofit clients while providing graduate and undergraduate students at Northern Arizona University with applied research instruction and experience. The Social Research Laboratory specializes in public opinion studies, needs assessments, program evaluations, and demographic and social issues analyses; the SRL also regularly employs telephone survey, mail survey, and focus group methodologies in research projects. Dr. Solop and Ms. Hagen would like to thank the many people who assisted with this project, including Arian Sunshine Coffman, Karin Ross, Anne Mottek-Lucas, Randolph A. Ottem, Kerry Nodal, Katharyn Lyon, Christopher Stringer, Lynn Spence, Joel Davis, and Kelly McCarrier.

## PACIFIC WEST REGION TECHNICAL REPORT TABLES

*[Note: The following tables have been placed in the order of the survey questions as they were presented to respondents and following the same order as the original survey]*

- 1) The National Park System consists of all the units managed by the National Park Service, including national parks, historic and cultural sites, and national monuments. How many times in the past two years have you visited a unit of the National Park System?  
*[All respondents]*

**Table 1.1 (General public) <sup>a</sup>**

	<b>PWR</b>	<b>National</b>
Have not visited within past two years	41%	46%
Visited 1 time within past two years	12%	12%
2 times within past two years	14%	12%
3 times within past two years	6%	7%
4 times within past two years	6%	5%
5 times within past two years	4%	4%
6 times within past two years	4%	3%
7 times within past two years	1%	--
8 times within past two years	3%	1%
9 times within past two years	--	--
10 times within past two years	4%	3%
11 times within past two years	--	--
12 times within past two years	1%	1%
13 times within past two years	--	--
14 times within past two years	--	--
15 times within past two years	1%	1%
Other – more than 15 times within past two years	4%	3%
Don't know	1%	2%
<b>Total</b>	<b>100%</b>	<b>100%</b>
<b>Total N</b>	<b>N = 538</b>	<b>N = 3506</b>

Totals may not equal 100% due to rounding.

\* Statistically significant difference based on  $p \leq .05$ .

<sup>a</sup> Chi Square may not be stable due to small counts in one or more cells.

<sup>b</sup> Chi Square test not applied.

- 2) Have you ever in your lifetime visited a national park, historic or cultural site, monument, or other unit managed by the National Park Service?  
*[Question asked only of respondents who had not visited within the past 2 years]*

**Table 2.1 (Non-visitor)**

	<b>PWR</b>	<b>National</b>
Yes	72%	68%
No	24%	27%
Don't know	4%	6%
<b>Total</b>	<b>100%</b>	<b>100%</b>
<b>Total N</b>	<b>N = 227</b>	<b>N = 1671</b>

- 2a) The following table provides a comparison of all three respondent levels:  
 (1) Has visited within last two years and can name an NPS unit accurately  
 (2) Has visited within lifetime but not in last two years or is unable to accurately name NPS unit visited  
 (3) Has not visited an NPS unit in lifetime

**Table 2a.1 (General public) \***

	<b>PWR</b>	<b>National</b>
Has visited within last 2 years and can name an NPS unit accurately <i>(Visitor survey)</i>	39%	32%
Has visited within lifetime but not in last 2 years or is unable to accurately name NPS unit visited <i>(Non-visitor survey)</i>	50%	53%
Has not visited an NPS unit in lifetime <i>(Non-visitor survey)</i>	12%	15%
<b>Total</b>	<b>100%</b>	<b>100%</b>
<b>Total N</b>	<b>N = 538</b>	<b>N = 3506</b>

Totals may not equal 100% due to rounding.

\* Statistically significant difference based on  $p \leq .05$ .

<sup>a</sup> Chi Square may not be stable due to small counts in one or more cells.

<sup>b</sup> Chi Square test not applied.

- 3) Please tell me what first comes to mind when you hear the words “National Park System.” [Open-ended question; recoded into discrete categories] [All respondents]

**Table 3.1 (General public)<sup>a</sup>**

	<b>PWR</b>	<b>National</b>
Beauty, nature, flora, fauna	28%	29%
Named a specific park	20%	21%

- 24) Now, I am going to read three ways of managing money from entrance fees received by the National Park Service, and I would like to know which method you prefer. First, all entrance fee money could stay within the National Park System unit where it is collected; second, all entrance fee money could be sent to the National Park Service headquarters with a percentage going back to the unit where it was collected and the remainder sent to other units; or, third, all entrance fee money could be sent to the U.S. Treasury with a small percentage sent back to the National Park Service to cover costs of collecting the money. Which method of managing entrance fee money do you prefer? [Response options were rotated in the question during the survey] [All respondents]
