Petersburg National Battlefield: Eastern Front Unit

Petersburg National Battlefield's Eastern Front Unit encompasses 1,440 acres of hardwood and pine forests, riparian areas, grasslands, vernal pools, and creeks. Such a wide range of habitat support a diverse array of bird species. So far, over 100 species of birds have been detected in the Eastern Front Unit including bald eagles.

This checklist was developed from inventories conducted in the park in 2003 by scientists from the College of William and Mary and observations by park staff. The abbreviations below indicate when species are most likely to be seen in the park. Space is provided on the left for you to check off the species you observe during your visit.

The **Podcast** "Birds of Petersburg National Battlefield: Eastern Front Unit" is available at http://www.nps.gov/pete/naturescience/birds and contains calls of some of the more common birds listed here.

Detection key:

When birds could be detected in the park: B = Breeding season (breeds in park) May 15th to August 1st b = Breeding season (breeds locally) May 15th to August 1st R = Year-round resident W = Winter season Nov. 15th to March 15th T = Migratory transient, not present during breeding or winter seasons March 15th to May 14th and Aug. 15th to Nov. 15th

Note: Detection season dates are estimated guidelines.
